# Q Series

## How to Program Q Series Flood Mode

Flood mode or all white steady on is really simple to program. On your Q Series light Heads, let me show you how that's done. To start, I'm gonna apply power to my mode wire. The light will flash in a blue steady on pattern, which is a factory default. I'll take my blue wire, which is my pattern changer wire, and tap it to ground until I get to the steady on pattern. Now, don't be confused by two steady on patterns. The first one is a brake pop pattern, which we would not want to use for a flood activation. I'll tap again. Now I'm on a tail light, which is a dim cruise mode pattern. I'll tap again, and now I'm on full intensity, steady on notice. When I disconnect power, the light turns right on and doesn't break pop. I'll then connect my green wire to power 12 volts to cycle through the colors. Red, amber, and now white. And there you have it. I now have white steady on full intensity, programmed on my mode wire.
